                                     The invention relates to a target protein fused with a polypeptide having an amino acid sequence containing an epitope of anti-human type II DNA topolsomerase alpha antibody and the DNA encoding it. The sequences can be used in a method for the detection or the determination of a target protein in which the target protein is detected or determined by using the reactivity between the target protein and the above fused protein as the index, and also in a method for the purification of a target protein in which the above fused protein is contacted to anti-human type II DNA topolsomerase alpha antibody carried on a solid carrier. This sequence represents DNA encoding an anti-human type II DNA topolsomerase alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, K-ras, PCR primer; probe, capture probe, mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English.

The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary coligonuclectide probes (I) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful so detecting infectious diseases caused by bacterial infectious agents of Salmonalia, Listeria monocytogenes and Hamophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and happeralius fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epsterian Barr virus and palasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Purner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, or method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe present or absence of the target mucleotide sequences. WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure, SEQ ID NO 13887; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the instantion codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of intitiation codon, confirm a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitificammatory steroid and ubjournone. A composition of the invention has antiinflammatory antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antimilammatory steroid in a subject, for reducing levels of adenosine or lung surfactant in a subject, for reducing levels of adenosine conjung surfactant in a subject, stating bronchoconstriction, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.

```
The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, mummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costinulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated DNA molecule encoding cholecystokinin receptor protein - are
                                                                                                                                                                               Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cholecystokinin receptor protein; CCK; gastrointestinal receptor; ss.

Mixed oligos primed amplification of CCK cDNA was performed using 2 groups of degenerate primers based on the AA sequence from AAR38890. The sense gp. of primers was 72 fold degenerate (AAQ47672). The anti- gp. of primers was 80 fold degenerate and consisted of AAQ47673. The anti- gp. of primers was 80 fold degenerate and consisted of AAQ47673 & AAQ47674. The product of the PCR was used to generate nondegenerate primers for subsequent PCR. The remaining 3' coding and UTRS was obefor using amplificn. (RACE) of CDNA and anchored PCR. RACE was performed using AAQ47675 for the first round and a nested primer, AAQ47676, for the second round. Anchored PCR used the gene specific primer AAQ47677 and the sequences was cloned using PCR. The sense primer was AAQ47677 and sequences was cloned using PCR. The sense primer was AAQ47679 and the antisense primer was AAQ47680. (Updated on 25-MAR-2003 to correct PN

The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid segments containing polymorphic sites, or complements and methods of detecting a nucleic acid - for general use including diagnosis and monitoring of diseases.

This sequence is an inhibitor of the human AUR2 protein of the invention. The AUR1 and AUR2 proteins can be used to identify specific modulators of, and to generate specific antibodies recognising AUR1 and AUR2. The modulators can be used for treating conditions involving abnormal AUR signal transduction, specifically cancer (of colon, breast, kidney, ovary, bladder, head or neck, also glioma, medullablastoma, kidney, chondrosparcoma and panoreatic tumnurs, particularly of colon (specifically), breast or kidney). The modulators can also be used for studying their effects in animal models of proliferative disease. Probes, based on the coding sequences are used, diagnostically, to detect or quantify AUR mRNA, by hybridistation or polymerase chain reaction (PCR). The DNA, optionally mutated, are useful in gene therapy. Ab are used as diagnostic immunoassay reagents for detecting the proteins
                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding human AUR1 and 2 polypeptides, used to identify specific modulators for treating cancer or for diagnosis.
inflammation, heart disease, CNS diseases, and susceptibility to infection by microorganisms. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of diseases, and also the use of the DNA segments as pharmaceutical

The present invention describes human mitogen-activated protein kinase/extracellular response kinase (MAPK/ERK) kinase kinase (MEKK). Pepocifically designated MEKKI, MEKKZ and MEKKI. The MEKK proteins are used to modulate and regulate signal transduction in cells, as well as for regulation of gene transcription in a cell encoding MEKK, where the cell is involved in inflammation, regulation of cellular prolliferation and differentiation, regulation of development, regulation of cell death or regulation of inflammation. They are also used to prepare antibodies. MEKK polymucleorides can be used to produce the protein recombinantly and as a source of probes and primers. The present sequence represents a PCR primer for human MEKK2, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human MEKK polynucleotides and polypeptides, used for regulating signal transduction in cells.

Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation. Example 20; Col 49; 48pp; English

The invention relates to a method of preparing plasminogen kringle 5

peptide fragments. The method comprises mixing mammalian plasminogen and
elastase in the ratio 1:100-1:300, followed by incubating and isolating
the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
endothelial cell proliferation and migration. The peptides are useful for
treating angiogenic diseases, primary and metastatic solid tumours and
carcinomas of various organs such as breast, genital tract, endocrine
glands, skin, tumours of the brain and eyes and solid tumours arising
are also used for the prophylaxis of various autoimmune diseases (e.g.,
rheumatoid arthritis), ocular diseases, skin diseases (e.g.,
blood vessel diseases (e.g. haemangiomas, Osler-Webber Syndrome),
creation of endothelial cells
(e.g., Crohn's disease, atherosclerosis), diseases which have
angiogenesis as a pathologic consequence (e.g., cat scratch disease and
clers). The peptides are also useful as a birth control agent which
inhibits ovulation and establishment of the placenta. Sequences AAA52294AS2304 represent PCR primers used in the construction of Escherichia cells
expression vectors for recombinant expression of various human plasminogen kringle 5 fragments

Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation

Example 20; Col 49; 48pp; English.

The invention relates to a method of preparing plasminogen kringle 5
clastase in the ratio 1:100-1:300, followed by incubating and solating
the fragments. The method comprises mixing mammalian plasminogen and
elastase in the ratio 1:100-1:300, followed by incubating and solating
the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
endothelial cell proliferation and migration. The peptides are useful for
treating angiogenic diseases, primary and metastatic solid tumours and
carcinomas of various such as breast, genital tract, endocrine
glands, skin, tumours of the brain and eyes and solid tumours arising
from haematopoietic malignancies such as leukaemias and lymphomas. They
are also used for the prophylaxis of various autoimmune diseases (e.g.,
rheumatoid arthritis), coular diseases, skin diseases (e.g.,
plood vessel diseases (e.g. haemangiomas, Osler-Webber Syndrome),
cliseases caused by axcessive or abnormal stimulation of endothelial cells
(e.g., Crohn's disease, atherosclerosis), diseases which have
angiogenesis as a pathologic consequence (e.g., cat scratch disease and
ulcers). The peptides are also useful as a bitth control agent which
chibits ovulation and establishment of the placents. Sequences AAA52294.
A22304 represent PCR primers used in the construction of Escherichia coli
expression vectors for recombinant expression of various human fragments kringle 5

```
The present invention relates to a cholecystokinin (CCK) receptor protein. The CCK receptor-encoding DNA molecule is useful for expressing and purifying CCK receptor protein to sequenceable-grade homogeneity. The CCK receptor proteins or fragments are useful for obtaining antibodies that can recognize CCK-expressing cells. The transformed eukaryotic cell lines are useful for studying the receptor in an environment similar to its native environment, e.g. in the context of studying the electrophysiology or binding properties of the receptor. The transformed prokaryotic or insect cell line is useful for expressing CCK receptor to produce large amounts of the receptor for immunological purposes or for studying protein structure, e.g. crystallography
                                                                                                                                                                                                                                                                                                                                                               New cholecystokinin (CCK) receptor-encoding DNA molecule, useful for producing and purifying human CCK receptor protein to sequenceable-grade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myceardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various obly morphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, concary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, variant thrombospondin 1; variant thrombospondin 4; SNP;

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various opportantly objerception of the within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                         Mucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various bolymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPs shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (infedipline oxidase), polypeptide 5 (CYPAAS) polymuclectide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate correction or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of troatment efficiently dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM36013 represent sequences used in the exemplification of the present invention

New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.

Disclosure; Page 32; 86pp; English.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or panoreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (infedipine oxidase), polypeptide 5 (CYP3A5) polynucleotide (II). (I) and (II) have

Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1 polynucleotide. 

Disclosure; Page 41; 100pp; English.

The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) golynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.

This invention relates to a novel isolated DNA molecule encoding a cholecystokinin (CCK) receptor protein. The invention also discloses a method for purifying a CCK receptor by solubilising a biological preparation containing CCK receptor in 1% digitionin, applying the solubilised receptor preparation to a cationic exchange resin and purifying the eluate of the resin. The purified eluate is then added to an agarose-bound lectin and applied the eluate to a cibacron blue sepharose column and a CCK receptor protein of sequenceable-grade purity. The CCK receptor protein of the invention may have immunomodulatory activity. The DNA molecule of the invention may have immunomodulatory activity. The DNA molecule of the invention is useful for purifying CCK receptor protein to sequenceable-grade homogeneity. The CCK proteins are useful for neuroendozine modulation of the immune system, and for obtaining antibodies that a recognise CCK-expressing cells. The present sequence represents a RACE PCR primer used to amplify the 3' end of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated DNA molecule encoding a cholecystokinin (CCK) receptor protein, useful for neuroendocrine modulation of the immune system, and for obtaining antibodies that can recognize CCK-expressing cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for the use of irinotecan (1) or treating colorectal, cervical, gastric, lung, ovarian or pancreation for cancer, or malignant glioma in subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRR1) polynucleoctide (II). (1) has cytostatic activity. (1) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic ancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTAL gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant gliona. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; irinotecan; cancer; UGT1A1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member A1.

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAL gene, and if the patient has one or more variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTALA gene. The invention has cytostatic activity. A composition of the invention acts as a topolsomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant gliona. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                   Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; human; ds; Cyp3A5; MRP1; MDR1;

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating coloractal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (WDR1) polymolectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide. Claim 4; Page 69; 130pp; English WPI; 2003-268145/26.

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polymucleotide.

Claim 4; Page 69; 130pp; English.

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal cervical, gastric, lung, ovarion or pancreatic cancer, amalignant glioma in a subject having a genome with a variant allele which

ö comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the Gaps ö Length 21; 3; Indels Sequence 21 BP; 0 A; 6 C; 9 G; 6 T; 0 U; 0 Other; Score 14.2; DB 1; Pred. New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

Disclosure, Page 41; 104pp; English.

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gloma in a subject having a genome with a variant allele which comprises a multidrug resistance ! (MDR1) polymuclectide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.

```

The invention relates to an isolated or purified polymucleotide encoding a polypeptide (the wild-type form of which is involved in synaptogenesis) that includes at least one mutation associated with development of eneurological disease and/or a predisposition to development of mental contents that modulate their activity. Also mucleic acid, polypeptide, polypeptide agents that modulate their activity. Also mucleic acid, polypeptide, or polypeptide are used to screen for agents that modulate their activity. Also mucleic acid, polypeptide, or host cells containing the vector, are useful as pharmaceuticals for treating mental and neurological disorders, specifically autism, Asperger syndrome, schizophrenia and attention deficit hyperactivity disorder. The wild-type forms of the nucleic acid and polypeptide can be used similarly. Also detecting mutations in the nucleic acid and polypeptide, can be used to disorders that affect formation of syndroms to dispusse and to disgnose mental disease. This sequence corresponds to a PCR primer used to amplify the human wild type HNL4X (ADC24764) and HNL4Y (ADC24764) genes.

New nucleic acid encoding mutant protein involved in synaptogenesis, useful for treatment and diagnosis of e.g. autism, Asperger syndrome, and schizophrenia.

Example 1; SEQ ID NO 21; 416pp; French.

```
This invention relates to novel isolated peptides that selectively bind to mammalian atherosclerotic lesions and as such can be used to detect to mammalian atherosclerotic lesions and as such can be used to detect the in vivo identification of such peptides by using phage display conditions of such peptides by using phage display the peptides. Diagnosis of pathological conditions of the cound by the peptides. Diagnosis of pathological conditions of the endothelial tissue occurs by administration of a peptide conjugated to reporter molecule or therapeutic agent. As such, these peptides can be described variously as antiatherosclerotic, cerebroprotective, antianginal, thrombolytic, cardiant, ophthalmological, neuroprotective, oppides as useful for treating atherosclerosis, as well as identifying the location and severity of an atherosclerosis, myocardial infarction, ischaemic heart disease, transplantation-induced sclerosis and confinence, it is associated with diabetes, which in turn can lead to peripheral artery disease, congestive heart fallomuclectide sequence, isolated from a combinatorial phage display colliboraty, encodes a peptide that binds to atherosclerotic lesions, the aim
                                                                                                                                                                                                                                                                                                                                       Novel peptide which selectively bind to mammalian atherosclerotic lesions, useful for treating atherosclerosis in a mammal, and for identifying location of atherosclerotic lesion in mammal.

```
The present invention describes a novel enzymatic nucleic acid (ENA)

chaving a hammerhead motif (HM) comprising: (1) at least 5 ribose residues

chaving a hammerhead motif (HM) comprising: (1) at least 5 ribose residues

con inhibit a 2'-C-allyl modifications; and (iv) a 3'-end modification. The ENA's

con inhibit collagenase and stromelysin production in the synovial

con inhibit collagenate and stromelysin production in the synovial

con inhibit collagenathritis or rheumatoid arthritis. The ENA's can also

particularly osteoarthritis or rheumatoid arthritis. The ENA's can also

be used to treat antigen presenting cells of a donor to induce tolerance

con a recipient to an alloantism of a donor to induce tolerance

con a recipient to an alloantism of autoimmune disease, and for

confacting alergies and other inflammatory conditions. The ENA's can also

treating allergies and other inflammatory conditions. The ENA's can also

confacting alergies and other inflammatory conditions the ENA's can also

conceptagin without introducing the non-specific effects upon gene

expression which accompany treatment with retinoids and dexamethasone.

The concentration of ribozyme required to affect a therapeutic treatment

conceptic. The present sequence is used in the exemplification of the

conception of the present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes (A) an isolated HIV-1 Group O env polypeptide. Also described are: (1) an isolated HIV-1 Group O env polypeptide. Also described are: (1) an isolated HIV-1 Group O env polypeptide as in (A) or (1); (2) a polymuclactide (PN) encoding a polypeptide as in (A) or (1); (3) an antigen construct comprising a first HIV-1 Group O env polypeptide; (4) an antigen construct comprising a fusion of at least one HIV-1 Group O env polypeptide with at least one HIV-1 Group O env polypeptide, (4) an antigen construct comprising a fusion of a first HIV-1 Group O env polypeptide with at least one additional HIV-1 polypeptide; (6) an antigen construct on a first HIV-2 env polypeptide; (6) an antigen construct as in (3)-(6), (8) an expression vector comprising a pN as in (7); (9) a host cell transformed by an expression vector as in (8); and (10) an immunosesay kit for the detection of antibodies to HIV-1 comprising an antigen construct as in (3)-(6). The antigen constructs can be used for the detection of anti-HIV-1 antibodies in test samples. They can also be used to publify HIV polypeptides, for therapy and for detection of HIV publication o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated HIV-1 Group O env polypeptides - used for the detection of anti-HIV antibodies and for the production of antibodies for use in detection, purification and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV-1; HIV-2; immobilised capture reagent; capillary action; screening, antibody; assay; env protein; PCR primer; ss.

The invention relates to a rapid assay for simultaneous detection and differentiation of antibodies to HIV-1 groups O and M, and HIV-2. The method comprises (a) contacting the sample with a strip containing at each of comprises (a) contacting the sample with a strip containing at least one immobilised capture reagent per analyte and on which the sample conditions sufficient to form capture reagent per analyte complexes, and (b) detecting a visible colour change at the capture reagent site on the strip wherein the capture capent site on the strip wherein the capture comprises a polypeptide shown in AAV66981-84; and that for HIV-1 group M comprises a polypeptide shown in AAV66981. The invention is used to screen patisents for antibodies to HIV-1 types O and M, and HIV-2. The invention will be particularly useful in the invention provides a screening method which is faster and requires less equipment than prior art methods. Sequences AAX37195-X37222 represent primers used for determining the env seqeunce of the HIV-1 coup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; secreted protein; immunestimulant; immunesuppressant; virucide; antibacterial; antifungal; cytostatic; antiinflammatory; dermatological; antidiabetic; antiasthmatic; antiarthritic; antirheumatic; profozoacide; antityproid; immune deficiency; averte combined immunedeficiency; SCID; infection; HIV; hepatitis; malaria; autoimmune disorder; systemic lupus; connective tissue disease; multiple sclerosis; erythematosis; rheumatoid arthritis; autoimmune pulmonary inflammation; asthma; duillain-Barre syndrome; autoimmune thyroiditis; myasthenia gravis; insulin dependent diabetes mellitus; graft-versus-host-disease; autoimmune inflammatory eye disease; allergy; hybridisation; probe; ss.
                                                                                                                                                                                                                                                                                       New rapid assay for antibodies to HIV-1 groups O and M, and HIV-2 - can
be used in field assay, requiring no electricity and less specialised
equipment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

Human immunodeficiency virus 1; group O isolate HAM112.

WO200004383-A2.

```
AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898

to AAY94980, isolated from human adult brain, adult thyroid, adult
retina, foetal arcinoma, adult blood, adult heural, foetal kidney, adult
placenta, adult testis, whole embryo, adult cartilage, kidney, foetal
callt bladder, cDNA libraries. The polymicleotides and proteins are
predicted to have biological activities which would make them suitable
for treating, preventing or ameliorating medical conditions in humans and
animals. The polymicleotides can be used as markers for tissues in which
the protein is preferentially expressed, as molecular weight markers on
Southern gels, and as chromosome markers or tags to identify chromosomes
or to map gene positions. The proteins can be used in the treatment of
immunedeficiency (SCID), as well as viral, bacterial, fungal and other
infections. These infections include human immunodeficiency virus (HIV),
the proteins can be used to treat autoimmune disorders such
as connective tissue disease, mycobacteria, leismania spp., malaria and
candidiasis. The proteins can be used to treat autoimmune disorders as connective tissue disease, multiple sclerosis, systemic lupus
as connective tissue disease, multiple sclerosis, systemic lupus
cuillain-Barre syndrome, autoimmune thyroiditis, insulin dependent
diabetes mellitus, myasthenia gravis, graft-versus-host-disease and
autoimmune inflammatory eye disease. The proteins can also be used to
treat allergic conditions, such asthma. AAA16688 to AAA16774 represent
probes for the human secreted proteins from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides encoding secreted proteins, which may have e.g. nutritional, chemokine, immune stimulating or suppressing, hematopoiesis regulating, tissue growth, activin/inhibin antiinflammatory or tumor inhibition activity.
                                                                                                                                                                                                                                                                                                                                                                                                    Collins-Racie LA, Evans C;

The invention relates to anti-HIV-1 group O monoclonal antibodies, which may be used as positive control reagents in immunoassays to detect and differentiate HIV-1 infections. The invention also encompasses a monoclonal antibody which binds specifically to an HIV-1 group O antigen, which has no more than 15% cross reactivity to a corresponding antigen selected from HIV-1 group M antigens and HIV-2 antigens; and a method of using a monoclonal antibody as a positive control reagent in an immunoassay for the detection of anti HIV-1 group O antibodies. The monoclonal antibodies are useful as positive control reagents in an immunoassay involve coupling a monoclonal antibodies. Such immunoassays involve coupling a monoclonal antibodies. Such immunoassays involve coupling a monoclonal antibodies. Such cantibodies of the invention would be used to ensure that the reagents or immunoassays involve coupling a monoclonal antibodies. Such antibodies of the invention would be used to ensure that the reagents provided to detect HIV-1 group O antibody were performing properly. The monoclonal antibodies are also generating chimeric antibodies for therapeutic used. Different synthetic, recombinant or purification of specific HIV-1 group O-derived proteins from the propersor of HIV antigens can be used in combination in assay to diagnose, evaluate, or prognosticate HIV disease condition. The monoclonal antibodies conformate, and amplify cDNA encoding the native env protein of HIV-1 group O, isolate HAM12. Sequences AA290187-290187 represent CC o, isolate HAM12. Sequences AA2901807 represent PCP prognosor AA2901801 represent pCP prognosor AA2901801 represent pCP prognosor of indiance of field)

Sequences AAC92738-C92817 represent antiense oligomucleotides targetted to the heterogeneous nuclear ribonucleoprotein A1 (hnRNP A1) gene, which inhibit isse expression. The antiense oligomucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. Cor their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. Cor their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. Cor their effect on hnRNP A1 mRNA levels by quantition in the stabilisation, transport and processing (including alternative splicing) of newly synthesised mRNAs. It facilitates the annealing of single-stranded nucleic acids, modulates the binding of snRNPs to RNA intron sequences, and shuttles continuously between the nucleus and the cytoplasm acting as a carrier protein for mRNAs. hnRNP correlating with shortened to a carrier protein for mRNAs. hnRNP correlating with shortened biogenesis, with low levels of hnRNP correlating with shortened telomeres. In addition, hnRNP A1 has also been classified as an apoptosis class engine grotein on the basis that it is specifically cleaved into three fragments during antibody-mediated apoptosis. Due to its ability to control splicing events, particularly donor splice site selection, hnRNP and invention are useful for diagnosis, prevention and treatment of the invention are useful for diagnosis, such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antisense compound targeted to human hnRNP A1 which specifically hybridizes with and inhibits the expression of human hnRNP A1, useful for modulating the expression of hnRNP A1 in cells.
                                                                     Human hnRNP A1; heterogeneous nuclear ribonucleoprotein A1; heterogeneous nuclear ribonucleoprotein core protein A1; p40CRS; mRNA processing; transport; stabilisation; alternative splicing; donor splice site selection; alternet biogenesis; oncogenesis; apoptosis-associated protein; cancer; tumour formation; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.
                         Human hnRNP Al phosphorothioate antisense oligonucleotide, SEQ ID NO:57.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 3.3%; Score 14; DB 1; Length 20; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3056, 3157, 327, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                           Human biallelic marker downstream amplification primer SEQ ID NO:8409.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism apulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification Probe; quantification; human; GTP binding protein; G protein; alpha subunit; specific mRNA; detection; hybridisation; diagnosis; pathophysiology; disease state; hereditary; cancer; infectious; osteodystrophy; pituliary tumour; acromegaly; melanoma cells; diabetes; PCR; polymerase chain reaction; ss. Synthetic.

The invention provides polymucleotides corresponding to exon 2 and exon 3 of human leukocyte antigen (HLA) alleles HLA-B\*3913, HLA-B\*1406 and HLA-B\*510 and exon 2 of HLA alleles HLA-D\*B1\*0620 and HLA-B\*510 and exon 2 of HLA alleles HLA-D\*B1\*0620, HLA-D\*B1\*04 and HLA-B\*510 and exon 2 of HLA alleles HLA-D\*B1\*0620, HLA-D\*B1\*06 and HLA-B\*10. The polymucleotides are useful for typing the above HLA alleles in a sample, especially by a method that comprises (a) amplifying all/part of the relevant sequence using at least one primer pair; and (b) hybridizing to target regions comprising one or more polymorphic nucleotides of the sequence, to determine the absence or presence of the angle in the sample. Diagnostic kits for (a) typing the alleles comprising at least one preferred primer and/or at least one preferred polymucleotides, comprising an antiserum or ligand (e.g. antibody) binding specifically to the protein fragment are provided. The polymucleotides also enable the isolation of the complete respective genes from a human genomic library

Sequence 17 BP; 3 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

The sequences given in AAQ47594-603 show regions of homology between jun sequences and the jun-B specific probe B-1258 which may be of use as jun-B specific probes B-1258 which may be of use as jun-B specific probes. They were used in the method of the invention for the detection and quantification of markha in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying a polymucleotide sequence unique to the mRNA, and immobilising an oligomer complementary to this sequence to an insoluble support. The sample is components are washed from the support such that the unique sequence will hybridise to the bound oligomer and bound RNA is labelled in such components are washed from the support and bound label is then camount of mRNA on the support. The amount of bound label is then amount of mRNA on the support. The amount of bound label is then determined. This method can be used for the reliable, rapid, simultaneous quantification of multiple varieties of mRNA. It may be used for diagnosing and recognition of pathophysiology of various disease states, eg. hereditary diseases, cancer, and infectious diseases. G proteins are thought to be involved in causing various diseases gates. A genetic deficiency of Gs protein is the molecular basis of hereditary costeodystrophy. Pituitary tumours in acromegalic patients have been shown conform multiple washed sproteins are also involved in invasive and metastatic melanoma cells, and diabetes. See also AAQ47381-666.

RIBOZYME PHARM INC. BLATT L. MCSWIGGEN J. CHOWRIRA B M. (RIBO-) I (BLAT/) I (MCSW/) N CHOM/)

Chowrira BM; Mcswiggen J, 'n, Blatt

Expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCD). The creation and processing and with a NRW motify processing an Indoxyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids desaving an RNA molecule possessing an NCH motify, a d-cleaver (cleaving RNA with a NRW motify) processing an NCH motify and cleaving RNA with a NRW motify processing an NCH motify and cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a STAT motify). The CD20-targetting nucleic acid is used to cleave RNA of cofficion in the presence of a divalent cation that is preferably Mg^2+.

C Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more theoremia, HIV (human immunodyform) low-grade or follicular NHL, lymphocytic lymphoma, leukaemia, HIV (human immunodeficiency virus) associated WHL, mantle-cell lymphoma (NCL), immunocytona (MMC), small B-cell lymphocytic lymphoma, immunocytona (MMC), small B-cell lymphocytic lymphoma (NCL), immunocytona (MMC), small B-cell lymphocytic lymphoma (NCC), immunocytona (MMC), small B-cell lymphocytic lymphoma (NCC), immunocytona (MMC), small B-cell lymphocytic lymphocytic catid may be contacted with a cell to reduce NOGO gene in the cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the NOGO. The treatment may further comprise the use of one or more contact central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzahemer's disease, dementia, multiple sclerosis (MS), charapies. In particular, the NOGO-targetting nucleic acid may be used to cleave which respond to the modular disease, central disease, dementia, multiputed neuropathy, and/or other neurodegenerative of steases which re Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and sequence is an inozyme of the invention Claim 88; Page 79; 200pp; English. central nervous system injury.

```
The present invention describes a human genome-derived myosin-like correction; (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 concleic acids can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify convide initial substrates for the recombinant engineering of hGDMLP-1 proteins are proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific blomolecule and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therappeauting specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concurration and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concurration and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed capture. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO capture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Shannon ME;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule captures probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed of the sequence data for this patent did not form part of the printed of the printed in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:7560.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The present sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. hGDMLP-1 sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, for raising antibodies that recognize hGDWLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDWLP-1.
                                                                                                                                                                hGDMLP-1; heart;

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as productive supplement in patients having specific deficiancy in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosting a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 covide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specifically of hGDMLP-1 candor amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the replacement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration disorders associated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders, hGDMLP-1 in particular heart cand skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part to the printed specification, but was obtained in electronic format directly from MIPO cat figure probablished_pct_sequence

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and fortal liver, bone marrow, brain, kidney, lung, placenta, prosette, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL. (AEOM-) AEOMICA INC.

Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (S1), (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequence comprising at least 8 contiguous amino acids. Human POSHL 11s a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GrPsess as well as communities of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) conced by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating treansgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the prime by the Buropean Patent Office

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonuclocides (AB10312-AB131809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as priners for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals Sequence 17 BP; 3 A; 5 C; 6 G; 3 T; 0 U; 0 Other; xxxyyyyyyyxxx

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 40; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NPKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^22+. The enzymatic and

prostate, colorectal brain, oesophageal, stomach, bladder, pancreatic, prostate, colorectal brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paciltaxel, docetaxel, cipplatin, methotrexate, gemitabine or radiation therapy. The enzymatic and antisense nucleic coid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomeruhonephritis, september alway inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 400; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD212, MD221, MD212 encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p11.2 and MD212 is encoded at chromosome 15p26.1, The MD23, MD24, MD27, and MD212 sequences are useful in therspy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23,

```
ö
MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression, RNA synchesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; inozyme; inozyme; amberzyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degemerative; disease state; HBV infection; HCV infection; dirrhosis; livar failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HTV) or the synthesis, expression and/or stability of Hepatitis C virus (HTV) or the patitis B virus (HTV) RNA. The nucleic acid and such as hammerhead ribozymes, DNAzymes, and enzymatic nucleic acid such as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, or are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence substrate for one of the HCV invention are useful for the treatment of acid season states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular incoming the present sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention

New polynucleotides for human leukocyte antigen, HLA, allele fragments, useful for typing HLA alleles.

Claim 16; Page 18; 62pp; English.

The invention provides polynucleotides corresponding to exon 2 and exon 3 of human leukocyte antigen (HLA) alleles HLA-B\*3913, HLA-B\*1406 and HLA-B\*51 and exon 2 of HLA alleles HLA-DRB1\*0820, HLA-DRB1\*04 and HLA-DRB4\*01. The polynucleotides are useful for typing the above HLA alleles in a sample, especially by a method that comprises (a) amplifying all/part of the relevant sequence using at least one primer pair; and (b)

This oligonucleotide represents a soybean retroelement primer binding site (version 2). The invention provides molecular tools in the form of retroelements and retroelement-containing vectors, cells and plants.

Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically. Consideratistic. In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an agronomically significant and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrates, reverse transcriptase, protease or RNAse-H sequence (see AAZ5254-661). Also provided are plant retroviral particles that are used to transfer the nucleic acids into plant cells ö hybridizing the amplified product to a set of probes specifically hybridizing to target regions comprising one or more polymorphic nucleotides of the sequence, to determine the absence or presence of the allele in the sample. Diagnostic kits for (a) typing the alleles comprising at least one preferred primer and/or at least one preferred probe and (b) for detecting the protein fragment encoded by the polymucleotides, comprising an antiserum or ligand (e.g. antibody) binding specifically to the protein fragment are provided. The polymucleotides also enable the isolation of the complete respective Gaps New nucleic acid molecules for imparting agronomically significant characters to plants, especially soybean. 0 3.2%; Score 13.8; DB 1; Length 18; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for identifying a molecule involved in inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmaxi. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders Molecules identified by comparison of zmaxl and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone disease. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers and adapters of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, compidentifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3.2%; Score 13.8; DB 1; Length 18; 88.2%; Pred. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosas, Pager's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82038

The invention relates to a truncated neublastin polypeptide comprising an amino acid terminus that lacks one or more amino-terminal amino acids of a mature neublastin polypeptide. The polypeptides and nucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral soletosis, memory impainment, disbetes, real diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polynucleotide sequence is a neublastin PCR primer of the invention Sequence 18 BP; 3 A; 7 C; 6 G; 2 T; 0 U; 0 Other;

The invention relates to novel transgenic animals expressing the high comprising an alteration of the gene encoding LRFS or LRFG, or expressing an alteration of the gene encoding LRFS or LRFG, or expressing an important is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention has osteopathic and cytostatic activity. The polymucleotides of the invention may have a use in gene therapy. The transgenic animals and condense in more than one parameter selected from bone density, bone cytostatic acids are for the study of bone eissue connectivity. The species in more than one parameter selected from bone density, bone cytostatic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone connectivity. The compositions, which may be employed for treating or preventing bone connectivity in methods for diagnosing diseases, paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also confositions, when the contained so the parameter sequence is not the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                    New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by reduced bone density.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

                                                                                                                                                                                                                                                                                             The present invention relates to High Bone Mass (HBM), LRPS (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bene mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lymphocyte specific interferon regulatory factor; LSIRF; IRF-3; probe; major histocompatibility complex; MHC; ISRE; interferon-stimulated response element; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This 3'-PCR primer is used in a novel method for identification of allele types (in this case human leukocyte antigen (HLA) class II gene alleles) of a known polymorphic genetic locus in a sample. The allele type is identified by first combining the sample with a sequencing reaction mixture containing a polymerase, nucleoside feed stocks, one type of suitable for template dependent primer sequencing primer under conditions suitable for template dependent primer extension to form a number of oligonucleotide fragments of differing lengths, which are then evaluated corresponding to the chain terminating bases in the primer. However, this method differs from standard sequencing procedures, instead of performing
                                                                                     The murine major histocompability complex interferon-stimulated response element (MHC IRSE) binding sequence (AAT41709) was used as a probe to determine whether novel mouse lymphocyte-specific interferon regulatory factor (LSIRF) (see also AAR99426) is a DNA binding protein. LSIRF polypeptides were incubated with 32P- labelled double-granded probe and, in some cases, with unlabelled competitor DNA fragments (see also AAT41710-16). Gel shift assays showed that the MHC ISRE sequence binds LSIRF protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identification of allele type of a known polymorphic genetic locus - used particularly for human leukocyte antigen allele determination.
genes for murine lymphocyte specific interferon regulatory factor d for modulation of lymphocyte activation and proliferation.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps

and evaluating four concurrent reactions, the sample is concurrently combined with at most three sequencing reaction mixtures containing different types of chain terminating nucleosides. The method can be used for the evaluation of polymorphic sites, and for determining the allelic type of a polymorphic gene. The methods are particularly useful for determining the HLA allele present in a sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide tags fixed to a solid substrate. The oligonucleotide tags array is useful for genotyping a nucleic acid sample at one or more loci wis single base extension (SEB) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to

The invention relates to prognosis or diagnosis of muscular steatosis by measuring the level of a muscular steatosis modulating factor (MSMF) in a human or animal and comparing this with the level in a healthy control. Any difference indicates presence of, or predisposition to, muscular steatosis. The method is particularly used for diagnosis or prognosis of muscular steatosis in mammals and birds, e.g. to select individuals as founders in animal breading. Also (ant)agonists of MSMF can be used to treat, or induce (for increasing the fat content of food) muscular steatosis, in humans and animals. The MSMF markers are also useful in the study of diseases and conditions such as obesity, hyperlipidaemia, atherosclerosis, wound healing, tumours and amyotrophic lateral sclerosis invention from its gene ö Prognosis and diagnosis of muscular steatosis, useful e.g. for selecting animals for breeding, by measuring levels of specific markers, also treating or inducing steatosis. Neuregulin-2 polypeptide and polynucleotide useful for treating multiple sclerosis, spinal muscular atrophy, nerve injury, Alzheimer's disease, by increasing mitogenesis, survival, growth or differentiation of a cell.

Example 1; Page 29; 79pp; English

The invention relates to a substantially pure neuregulin (NRG)-2

COT NRG-2beta (Coince 2b7) and the polymolecideds encoding the Also

COT NRG-2beta (Coince 2b7) and the polymolecideds encoding the Also

included are a vector expressing the protein, a host cell comprising the

corrector, a transgenic non-human animal transformed with the vector or

vector, a walvest of mutation in one or both NRG-2 allelss and an anti-NRG-2

antibody. Analysis of mutations in NRG-2 in an individual is useful for

diagnosing an increased likelihood of developing a NRG-2-related disease

or condition in a test subject. NRG-2 is useful for increasing the

mitogenesis, survival, growth or differentiation of a cell (e.g. a

concomition in a test subject. NRG-2 is useful for increasing the

mitogenesis, survival, growth or differentiation of a cell (e.g. a

The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing three or more variable variable sites are typed, where three or more primer extension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence represents a PCR primer used in the invention to amplify a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Adeno-associated virus; AAV; integration locus; CpG island;

                                                                                                                            In the cloning of AAVS1 from human lung fibroblast DNA, the primers given in AAQ63193-202 were used. A 4kb fragment contg. the AAV integration site was obtained (AAQ63192). (Updated on 25-MAR-2003 to correct PN field.)
                                               New nucleic acid corresponding to human adeno-associated virus integration site - useful e.g., as probe to confirm targetted integration of adeno-associated virus vectors in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New HIV-type immune deficiency virus ECACC V 92092318 - and deriv. cDNA or antigens, useful for diagnosing retroviral infections and vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MVP-5180/91 DNA is obtained by PCR using the primers given in AAQ58925-
958. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-
2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human immunodeficiency virus; HIV; antigen; detection; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                            Primers SS01 (given in AAQ76031) and SS02 (AAQ76032) were.used for the PCR amplification of a target region (AAQ76037) in the cytosine-DNA-methyltransferase of N. gonorrhoeae. Probe SS06-T5 (AAQ76033) is specific for a region in the amplified sequence, and is used to identify N. gonorrhoeae. (Updated on 25-MAR-2003 to correct PN field.) This invention describes the isolation of a novel HIV-type retrovirus called MVP-5180/91 (ECACC V 92092318). Antigens produced from this product can be used in an assay kit for detecting antibodies against viruses that cause immune deficiency, preferably where the assay is a Western blot, ELISA or fluorescence immunoassay. MVP-5180/91, cDNA and/or antigen can be used for detecting retroviruses that cause immune deficiency and to prepare vaccines. This sequence represents a PCR primer used in the method of the invantion. (Updated on 20-MAR-2003 to correct PF field.) (Updated on 20-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Retinal calcium channel; RCC gene; alphalF-subunit; retinal disorder; myopia; nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human; CACNAIF; CSNB; mutational analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                       New HIV-type retrovirus and corresponding cDNA, recombinant DNA and antigen - used for detecting retro-viruses that cause immune deficiency and to prepare vaccines.

The invention provides a DNA molecule comprising a sequence of nucleotides encoding an alphalF-subunit of a mammalian retinal calcium channel (RCC), including a human alphalF-subunit, a murine alphalF-subunit and orthologs of the human and murine alphalF-subunits. The RCC gene may be used to develop products for diagnostic tests, for incomplete CSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSMB may be caused by calcium-requiated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to reatment for related eye disorders or diseases. Sequences AAZ46563-650 represent human CACNALF (alphalF-subunit of RCC gene) exon-specific PCR primers, used for mutational analysis in humans

New avian paramyxovirus cDNA, useful for production of vaccine against Newcastle disease virus.

This invention describes a novel avian-paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exagences proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially adainst respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively chapte as application methods e.g. drinking water or by spraying or by across are relatively stable and can be simply administered chap. Mass application methods e.g. drinking water or by spraying or by across prointestinal tract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. AAZ44618-244650 represent primers used in the isolation of the NDV strain LaSota genome

geparation of the amino acid which they specifically recognise and in quantitations of the amino acid and ATP, and for detecting and indentifying inhibitors of their activities. The potential inhibitors of these enzymes can be screened for antimicrobial or antibiotic effects, without requiring the culture of pathogenic strains of Enterococcus. The antibodies which bind to these enzymes can be made and used in the purification and study of the enzymes. The aminoacyl-tRNA synthetase genes may be used as probes to identify DNA fragments are used in the production of proteins or polypeptides, and the aminoacyl-tRNA synthetase genes may be used as probes to identify DNA fragments encoding the corresponding aminoacyl-tRNA synthetase gene from other species of enterococci by specific hybridisation. The present sequence is a PCR primer which is used for amplifying the C-terminal Enterococcus faecalis phenylalanyl-tRNA synthetase (PheRS) DNA

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG sednences

Claim 5; Page 44; 48pp; English.

AASO9551-AASO9662 represent oligodeoxynuclectides (ODN) of at least 10 nuclectides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The ODN are useful for inducing an immune response, preferably a cell-mediated immune response, preferably a cell-mediated immune response, involving non-B cell activation, interferon

cell activation, antibody and interleukin-6 production in a host, for treating, prevention, antibody and interleukin-6 production in a host, for treating, preventing or ameliocating an allergic reaction, e.g. asthma, cancer, e.g. solid tumour cancer, a disease associated with the immune cystem e.g. autoimmune disorder or an immune system deficiency, infection of a symptom resulting from exposure to bio-warfare agent in a human. The corduction of immune response improves the efficacy of a vaccine and isc used in antisense therapy. The ODN are useful for treating, preventing or used in antisense therapy. The ODN are useful for treating, preventing or coryza, hay fever, bronchial asthma, urticaria (hives), food allergic radictions, including eczema, allergic radictions, for improving the efficacy of vaccines or adainst hepatitis A, B and C, human immunodeficiency virus (HIV) and malaria, for treating immune system deficiencies, e.g. lupus corythematosus and autoimmune diseases such as rheumatoid arthritis and comultiple sclerosis, infections including Francisealla, eschistosomiasis, cuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Ebola, xxx

Novel antisense compounds for modulating the expression of Survivin and treatment of cancer.

Example 18; Page 60; 120pp; English.

The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonucleotide inhibits the expression of human Survivin. These antisense oligonucleotides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a hyperproliferative condition such as cancer, and comprises administering a therapeutically or prophylactically effective amount of the antisense oligonucleotide so that expression of Survivin is inhibited. ô
oligonucleotides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to a human. In addition, the antisense oligonucleotide and a cytotoxic chemcherapeutic agent e.g. taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the cell cycle, or inhibit the proliferation in a cancer cell by contacting the cell with the antisense oligonucleotide. AAS1521-AAS21768 represent Survivin nucleic acids, and antisense oligonucleotides targeted to Survivin, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a microarray of oligonuclectides comprising probes for the human HLA Class I genes attached to a solid support. These can be used in HLA typing. Oligonuclectide arrays are also useful in large scale gene discovery, monitoring gene expression, polymorphism detection and gene mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide arrays useful for human leukocyte antigen (HLA) tissue
typing, comprises HLA class I oligonucleotide probes representing all
known polymorphisms in HLA class I locus, on a solid support.
                                                                                                                                                                                                                                                                   0; Gaps

The invention relates to constructing (M1) a strain of diploid fungal calls in which both alleles of a gene are modified, comprising modifying calls in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a fungus; a gene chart, an antifungal agent that inhibits the growth of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter, transcriptional, transduction, part is compound having the ability to inhibit growth or proliferation of C. albicans cells and for transtraint infection by C. albicans. The present sequence is that of a por primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0, Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 36; SEQ ID NO 4516; 167pp + Sequence Listing; English

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allale by insertion or replacement by asserte having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the relatione and/or pathogenicity of a fungus, a gene that contributes to the relational of a diploid fungus to an antifungal agent that inhibits the growth of a mammalian disease. (M1) is useful for identifying a compound extabolism, biosynthetic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound having the compound actabolism, biosynthetic, transporter, transcriptional, transcribly ensymatic activity, carbon compound actabolism, biosynthetic, transporter, transcriptional, transcrible growth or proliferation of C. albicans cells and for treatment is not represented in the princed specification but is based on sequence information supplied to Derwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                          Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

New antisense oligonucleotide that targets regions of a nucleic acid encoding human receptor interacting protein (RIP)2, for treating diseases associated with RIP2 expression.

Claim 3; Col 46; 35pp; English.

ö

0; Gabs

The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is an oligonucleotide targetted to human RIP2 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain, derived from a bacterial daptomychin biosynthetic gene cluster. The proteins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodulator, antilipemic, and cytostatic activity. The polynucleotides may have a use in gene therapy. The compositions and methods of the present invention are useful for generating novel linear and cyclic peptides and improving yield of a product in a cell expressing and appromych non-ribosomal peptide synthetase (NRES) to be used as new compounds or in producing new compounds, such as antibiotics, antitumour agents, antifungals, anti-cholesterolemic agents, anti-cholesterolemic agents, affectophores, approximately agents, anti-cholesterolemic agents, incompounds and cycostatics. The sequence represents a PCR primer used in the invention to amplify the S. roseosporus daptomycin biosynthetic
                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with agene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forenaics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and infrared microscope) the support at the set occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funnigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an entilnflammatory steroid and ubjquinone. A composition may have a mutinflammatory steroid and ubjquinone, A composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an preventing sensitivity to adenosine, reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO

```

```
The present invention describes a method and a kit for determining the expression of mRNA or cDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type I collagen alpha 1 chain, type IV collagen alpha 1 chain, type IV collagen alpha 2 chain, TIMP-1, TMMP-3 and TIMP-3. ACF57290 represent PCR primers and probes used in the method of the

New compound, having a sequence targeted to a nucleic acid encoding mucin 1, transmembrane, useful for preparing a composition for treating hyperproliferative or inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonuclectides targetted to a nucleic acid encoding mucin 1 transmembrane (also known as MUC1, epistalin, epiterctin, polymorphic epithalial mucin; PBM, peanut-reactive urinary mucin; PDM, epithalial membrane antigen; BMA, PBS-0, NCRC11, H23 antigen, H23-ETA transmembrane antigen, DF3 antigen and CD227) to inhibit/modulate the expression of mucin 1 transmembrane. Antisense compounds of the invention are useful for preparing compositions for treating hyperproliferative or inflammatory disorders. The invention is also used in gene therapy. The present sequence is human mucin 1 transmembrane antisense oligonuclectide

WPI; 2003-606441/57.

New antisense oligonucleotides targeted to a nucleic acid molecule encoding complement component C3, useful for treating a disease or condition associated with complement component C3, e.g. autoimmune disorder or infection.

Claim 3; Page 27; 72pp; English.

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound complement component C3 and inhibite the expression of complement component C3 and inhibite the expression of complement component C3. Or specifically hybridises with at least an 8-nucleobase component C3. Also included are a composition of complement component C3. Also included are a composition comprising complement component C3. Also included are a composition comprising complement component C3 in calls or tissues (comprising the expression of complement component C3 in calls or tissues (comprising contacting the cclis or tissues with the compound cited above) and treating an animal captures and administering to the animal the compound cited above so that expression of complement component C3 comprising administering to the animal the compound cited above so that compounds are useful for inhibiting the expression of complement c3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an caucimmume disorder (e.g. multiple sclerosis), an infection, or atherosclerosis, inflammation, septic shock, multiple organ failure, computed the capture sclerosis, inflammation, septic shock, multiple organ failure and CNS inflammation. The compounding are also custful as research reagents and diagnostics, in distinguishing functions of various members of a biological pathway, or for preventing or delaying inflammation, inflammation. The present sequence is an animal parties and parties and path an antisense oligonucleotide targeting mouse C3.

The present invention describes a method for inducing the production of vascular endothelial growth factor (VEGF) by a cell comprising contacting the cell with a CpG oligonucleotide and therefore inducing the production of VEGF by the cell. Also described: (1) inducing neovascularisation in a tissue, comprising introducing a CpG oligonucleotide into an area of the tissue, where the formation of new blood vessels is desired, and so inducing neovascularisation in the area of the tissue; (2) promoting angiogenesis in an area of the subject where angiogenesis is desired, comprising introducing a CpG oligonucleotide to the area, and so promoting angiogenesis in the subject; and (3) screening for an agent that inhibits neovascularisation, comprising administering a CpG oligonucleotide to a non-human mammal and administering a CpG oligonucleotide to a non-human mammal and administering the agent to the agent is effective in inhibiting neovascularisation. The CpG oligonucleotides have vulnerary, vasotropic and antiarteriosclerotic capett is effective in inhibiting neovascularisation. The method and the CpG oligonucleotides can be used in gene therapy. The method and the CpG oligonucleotides can be used in new thord and such the capette in each as in subjects with a skin graft, subjects who exhibit male pattern baldness, or subjects with a skin graft, subjects who catherents at inhibit neovascularisation. The present sequence the present invention of the present invention of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inducing the production of vascular endothelial growth factor by a cell, useful for inducing angiogenesis, comprises contacting the cell with a CpG oligodeoxynucleotide.
                                                                                                                                                                                                                                                                                                                                                                           vascular endothelial growth factor; VEGF; CpG oligonucleotide;

The sense primer B3', tther with antisense primer B4' (see AAT16479), can be used in the polymerase chain reaction for amplification of the primate alpha-herpes virus gB glycoprotein gene in clinical or laboratory specimens. Following digestion of the amplified product with a restriction endonuclease (e.g. HaeIII), which is not capable of digesting herpes simplex virus (HSV)-1 and HSV-2, the digested fragments may be separated by size or may be hybridized with end-labelled oligonucleotide probe [B8].

The present sequence is an antisense oligomucleotide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The oligomucleotide has an average EC(90) (nM) of 150o, which refers to the comc. of oligomucleotide required to achieve 90 % inhibition of HIV p24 core antigen prodn. (contg. phosphorothioate linkages only)
                                                                                                                                                                                                                                                                                       Oligo:nucleotide(s) corresponding to HIV sequences - used for the detection of HIV or for inhibiting HIV propagation, partic. in infected

The present sequence is an oligomucleotide complementary to an antisense oligomucleotide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The DNA equivalent of the antisense oligomucleotide has an average EC(90) (mM) of 1500, which refers to the conc. of oligomucleotide required to achieve 90 % inhibition of HIV p24 core antigen prodn. (contg. phosphorothicate
                                                                                                                                      The present sequence is an antisense oligonucleotide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The DNA equivalent of the oligonucleotide has an average EC(90) (LMV of 1500, which refers to the conc. of oligonucleotide required to achieve 90 % inhibition of HIV p24 core antigen prodn. The invention provides the Simian herpesvirus B DNA (AAV33167) sequence coding for a gB glycoprotein (UL27; AAW70293) and a portion of an ICP 15. Kba protein (UL28; AAW70294). The invention uses these DNA and protein sequences as a basis for the development of differential diagnostic tests for the rapid identification of Simian herpesvirus B cases. Primer BV1 (AAV33169) and BV2 (AAV33169), along with the Simian herpesvirus B sequence specific PBs probe (AAV33179), were used in these diagnostic tests. Other primer sets used were the sense primers B3 (AAV33171) or B3' (AAV33172) and antisense primers B4 or B4' (AAV33174). Therefore, the virus can be detected by detecting the DNA sequence and knowledge of the amino acid sequence will help in the design of DNA production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Monkey herpes B virus DNA - coding for gB glycoproteins and polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, Mammary Gland Cancer Specific Gene, MSG, cytostatic, vaccine; cancer, therapy, immune response, PCR primer; ss.

New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome P450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypeptide S (CYPAS) polymelociticatic (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate
                                                                                                                                                                                                                               The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, crecation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide cytostatic; PCR primer; ss.
                                                                                  New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                            The present sequence is a PCR primer used for amplifying human mammary gland cancer specific gene (MSG) cDNA. MSG is useful for diagnosing, gland cancer specific gene (MSG) cDNA. MSG is useful for diagnosing, catecting, monitoring, staging, prognosticating, imaging and treating mammary gland cancer in a patient by determining the levels of MSG in cells, tissues or bodily fluids in a patient and comparing the determined levels of MSG with levels of MSG in cells, tissues or bodily fluids from a normal human control, where a change in determined levels of MSG in the patient versus normal control is associated with the presence of mammary control is used for identifying potential therapeutic agents for use in imaging and treating mammary gland cancer. MSG antibody conjugated to a cycloxic agent is useful for treating mammary gland cancer in a patient. MSG vaccine is useful for inducing an immune control managing and its protein and for treating mammary gland cancer in a patient. MSG and its protein and for treating mammary gland cancer in a patient. MSG and its protein are seful as diagnostic markers for mammary control and cancer and for diagnosis and treatment of disorders of cells,

New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.

Disclosure; Page 32; 86pp; English.

The present invention describes the use of irinotecan (1) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, gastric, lung, ovarian or panceatic cancer, or malignant glional as aubject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypeptide (1779AS) polymotechide (11). (1) and (II) have cytostatic activity. The therapeutic applications of (1) is improved, since it is possible to individually treat a subject with an appropriate derivative of (1). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of treatment with substances (nonresponders), as well as the development of change resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62701 and ABM34312 to ABM3613 represent sequences used in the

(I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                    irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; variant allele; multidrug resistance protein 1; MRP1; cytostatic; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1

```
The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAL gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTALA gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancraatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ss; irinotecan; cancer; UGTIA1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glloma; uridine diphosphate glycosyltransferasel member Al.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for the use of irinotecan (1) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic ancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1 polynucleotide.

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gateric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDR1) polymucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         irinotecan; colorectal cancer; cervical cancer; gastric cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                    The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAL gene. The invention has cytostatic activity. A composition of the invention acts as a topoisocmerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glicma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                     Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; human; ds; Cyp3A5; MRP1; MDR1;

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant

the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates ro a novel use of irinotecan or its derivative for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel use of irinotecan or its derivative for cervical, properation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidarug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         irinotecan; colorectal cancer; cervical cancer; gastric cancer;

Comparative analysis of regions close to both the 3' and 5' ends of small subunit ribosomal RNA sequences with near identity in the eukaryotic kingdom identified two consensus sequences. RRIB 1 and BRIB 10, spanning the ssrRNA genes contained within the genomic DNA prepd. from a number of Eimeria species, to determine the degree of similarity between ssrRNA from different Eimeria species. The probe Common4RC represents a sequence common to all Bimeria species which may be used to identify Eimeria infection. See also AAQ31283-332. NOTE: As specifications EP-516395. BP-516395. Early specifications can be found indexed under EP-516395. However the claims section, sequences for all these specifications can be found indexed under EP-516395. However the claimed sequences of each specialication will be indexed under their own patent number, thus each separate patent will be represented. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                Chromosomal DNA from Pseudomonas sp. 7A (ATCC 29598) was used to construct a genomic library in Escherichia coli LE392. Screening with mixed oligonucleotide probes was used to isolate a glutaminase encoding clone. This was sequenced using the primares given in AAQ68439-47. The gene can be used to manufacture recombinant glutaminase, free of Pseudomonas exotoxin, for use in e.g. HIV and cancer therapy. The gene may also be used in gene therapy protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the ganome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAZ01574-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoragnism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingtis, perihapatiis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                        The present sequence represents a novel oligonucleotide OL(8E)MRP that specifically hybridises in a human cell with a complementary sequence of human multidrug resistance-associated protein (MRP) gene. Hybridisation causes inhibition of expression of the multidrug resistance phenotype by the cell, due to the oligonucleotide having an aptameric inhibitory effect as well as an antisense inhibitory effect. The oligonucleotide season and an antisense inhibitory effect. The oligonucleotide is administered to cancer patients to prevent development of the multidrug resistant phenotype. When co- administered with chemotherapeutic agents, the oligonucleotide is useful for potentiating elimination of multidrug resistant tummour cells from bone marrow or peripheral stem cell grafts.
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                          Also, the oligonucleotide can be used as an immunosuppressive agent
                                                                                                                                                                                                                                                                                                                                                                                      ö

These ORFs anchode purple that the genome of Chlamydia trachomatis. Antiennes and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases uch as conventional trachom, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal unetritis, energidymitis, cervicitis, salpingitis, perimpgatitis, batholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                          AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                    Respiratory disease, pneumonia, bronchitis; heart disease, sarcoidosis, sinusitis; purulent otitis media; erythema nodosum, pharyngitis, vaccine, neutralising epitope; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human leukocyte antigen; HLA; class I allele type; probe; PCR primer;

The present invention describes a method for distinguishing a human belackocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtire plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judying donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and techniques. AAA666943 to AAA666977 represent oligonucleoride probes and PCR primers for use in the method of the present invention
                                                                                                                                                                                                                                                                                          Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease

The invention relates to the human angiotensingen (AGT) gene, some mutant alleles of which cause a susceptibility to insulin-dependent diabetes semilitus (IDDM, type I diabetes). The AGT gene is located on chromosome 1442-43, a region linked to IDDM. The invention discloses genomic sequences comprising an alternative AGT gene (AAC91600-C291604) and a genomic sequence comprising an alternative AGT gene (AAC91600-CC (AAC91606). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the mutant AGT alleles or gene products thereof which are related to detecting mutant AGT alleles or gene products thereof which are related to detecting mutant AGT alleles or gene products thereof which are related to IDDM, determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene, and methods of screening for drug candidates which may be useful in the treatment of diabetes resulting from an AGT mutation. Methods of preventing or treating diabetes are claimed which comprise the administration of a compound which agonises or antagonises wild-type or mutant AGT, which agonises a transgenic non-human animal, or cell line derived cerpensation, or which cleaves AGT proteins. In addition, the invention cencompasses a transgenic non-human animal, or cell line derived computators can be used to treat or prevent diabetes mellitus. AGT medulators can be used to treat or prevent diabetes mutant AGT gene createsing or frament used in an exemplification of the invention of alternative exon 1 PCR primer used in an exemplification of the invention
                        Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; mouse, SACI, carbohydrate; sweetener; ethanol; alcoholism; ss; obesity; diabetes; transgenic embryo; body tissue; body fluid; pancreas; blood; tongue; PCR primer; anorectic; antidiabetic; gene therapy; protein replacement therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *****************
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    synthetic or semi-synthetic nucleic acid sequences, not cloned from an municade source, where the nucleic acid sequences are derived from municades source, where the nucleic acid sequences are derived from municadenised immunoglobulins that are naturally devoid of light chains. The library is useful for the preparation of antibodies having binding specificity for a target antigen which avoids the need for a donor to have been previously immunized with the target antigen. The recombination of heavy and light chains is avoided, therefore preventing the formation of molecules that are non-functional. The number of hypervariable residues in the binding domain is reduced, allowing a more complete repertoire of possible binding variants to be obtained. The present sequence is a PCR primer targeted to anchor regions in liama antibodies. The primers (AAA73745 to AAA73745) amplified the framework regions P1, P2, F2c, F3 and F4. (Updated on 15-8EP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                   Expression library comprising nucleic acids not cloned from an immunized source, derived from immunoglobulins naturally devoid of light chains, use for producing antibodies specific for a target antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human angiotensinogen gene; ACT; insulin-dependent diabetes mellitus; type 1 diabetes; chromosome 1q42-43; single nucleotide polymorphism; IDDM; SNP; diagnosis; susceptibility; transgenic animal; drug screening; antidiabetic; gene therapy; alternative exon 1; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human angiotensinogen gene alternative exon 1 PCR primer, SEQ ID NO:17.

Novel isolated polypeptide comprising variant form of mouse or human SACI polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.

Claim 14; Page 75; 239pp; English.

The invention relates to an isolated polypeptide, comprising a variant form to f mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obseity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic or repress function of SAC1. Predisposition to diabetes, obseity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene, a sequence variation of the SAC1 lous may indicate a predisposition to diabetes, obseity and/or alcoholism and may provide a diagnostic mark. The polynuclectide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequence represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

Determining mutation in DNA, comprises attaching guanine-cytosine-rich clamp to DNA, fluorescently labeling DNA and mixing it with denaturant,

heating to melt DNA and comparing melting temperatures of DNA and its wild type.

Example 3; Col 10; 16pp; English.

PCR primers ABL41762-64 were used to amplify exon 2 of the N-RAS protonocogene, in the course of the invention. The specification describes a method for determining whether a DNA sequence contains an alteration. The method comprises attaching a DNA sequent comprising one or more copies of the DNA sequence to a guanine-cytosine-rich clamp, fluorescently labeling the DNA sequence to a quantine-cytosine-rich clamp, fluorescently labeling the DNA sequence of the DNA sequent and a wild type alteration in the DNA sequence. The method is useful for determining whether a DNA sequence contains an alteration. The method is useful for determining whether a DNA sequence contains an alteration. The method is usitable for detecting a mutation as small as a single base substitution in a relatively large DNA fragment. As the disparity in melting temperatures is most evident in a lower melting domain of a DNA fragment, it is possible to distinguish single base substitutions within lower melting domain

Producing homozygous stem cells having a target genotype and/or immunotype from non-fertilized post-meiosis I diploid germ cells, suitable for diagnostic, therapeutic and cosmetic transplant and

```
The present invention describes a method for producing homozygous stem

(HS) cells having a target genotype and/or immunotype from non-fertilised

post-meiosis I diploid germ cells by mitotically activating the germ

cells to develop multiple blastocyst-like masses, each of which contains

an inner cell mass (ICM) that is homozygous for the target genotype

and/or immunotype. The methods of the present invention are useful for

the production of HS cells utilised for diagnosis, therapeutic and

cosmetic transplantation, cell replacement and/or gene therapy, and the

treatment of various genetic diseases (cystic fibrosis, muscular

disease, Parkinson's disease and multiple solerosis), traumatic injuries

(post-trauma repair and reconstruction, limb replacement, spinal cord

injuries and burns), cancer disorders of the epithalium (blindness,

myopathy, atherosolerosis), Crohn's disease, alabetes, autoimmune

diseases and anaemia. ABQ74028 to ABQ74115 represent PCR primers and

sequence specific oligonucleotide (SSO) probes which are used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exemplification of the present invention

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure, SEQ ID NO 3540; 872pp; English

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, continuation codon, coding regions, or segions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an continual antial and a second active agent comprising an continual antial and a second active, hypotensive, has antiinflammatory, attiallargic, antiasthmatic, hypotensive, cuse in attisense gene therapy. The composition may have a cuse in attisense gene therapy. The composition may have a composition are prophylactic or therapeutic respiratory effect of an antisinal area prophylactic or therapeutic respiratory effect of an antisinal ammatory steroid in a subject, for reducing levels of continuing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine corpus professional antisense or condition, lung allergies, or treating bronchoconstruction, cung surfactant in a subject is tissue, or treating bronchoconstruction, lung allergies, or a respiratory disease or condition, or the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cut the printed at the printed are the prophylaction and the printed are the printed and the p

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 7971; 872pp; English.

first active agent comprising an oligomortectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinon. A composition of the invention has antiinflammatory, antiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antificlammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO The invention relates to a novel pharmaceutical composition, which has a at ftp.wipo.int/pub/published\_pct\_sequences

Katz E, Pabalan J, Aguilar D; Li Y, Sandrasagra A, K. Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 14007; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of compositions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensis ye, immunosuppressive, and cytostatic activity. The composition may have a sum inflammatory antiallergic, antiasthmatic, hypotensis ye, immunosuppressive, and cytostatic activity. The composition may have a comparisory, integrately and cytostatic activity. The composition may have a compressive, and cytostatic activity. The composition may have a correcting a replicatory, lung or malignant disease or condition, as so for reducing sensitivity, to adenosite, reducing or depleting levels of antinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creeptor, producing bronchodilation, increasing bronchocomstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of percification, but was obtained in electronic format directly from WIPO at first wino int/mh/mh/sibed and electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

```
The invention relates to a novel compound that is 8-50 nuclectides in length that is targeted to a nucleic acid molecule encoding and specifically hybridises with and inhibits the expression of a nucleic acid molecule encoding ApoB; or which specifically hybridises with at least an 8-nuclectide portion of an cartive acid molecule encoding ApoB; or which cartive atte on a nucleic acid molecule encoding ApoB; or which ancertic, and cardiovascular activity. The compound of the invention has antilipaemic, antisense oilgonucleotide is useful for treating an animal having a disease or conditions associated with ApoB, e.g. a condition involving an abnormal lipid metabolism, a condition involving an abnormal metabolism, atherosclerosis, or a condition involving an abnormal metabolism, atherosclerosis or cardiovascular disease). Obesity, atherosclerosis or cardiovascular disease). Obesity, atherosclerosis or cardiovascular disease). The new compound or the antisense oligonucleotide is also useful for modulating glucose levels in a human or diabetic animal, or for modulating serum cholesterol levels, lipoprotein levels (specifically VuDL, HDL or LDL) or serum triglyceride levels, contenting or delaying the onset of a disease or condution associated with ApoB, or the onset of an increase in glucose levels in the animal or invantion. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "OTHER= phosphorothioate backbone, where 1-5 and 16-20 are 2' methoxyethyl nucleotides. This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, IGFBF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                          New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PKA regulatory subunit RII alpha inhibitory oligonucleotide ISIS102782.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophlaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha inhibitory oligonucleotide New antisense compounds, useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha, and for treating a disease or condition associated with expression of PKA regulatory subunit RII The present invention relates to proteins that have been found useful increasing the breakdown efficiency of protein-containing substances. present sequence represents a primer of the invention. The invention relates to a method of identifying one or more biomarker genes for a type of cells among a group of (m) different cell types, from a multiplicity of genes whose expression levels in cells of the group are measured using nucleic acid arrays, to generate a plurality of measurements of expression levels for the m types of cells, by comparing rank order for the gene and (m-1) for each gene and detarmining a rank order for the gene among the multiplicity. The method is useful in identifying biomarkers using nucleic acid microarrays. The biomarkers of skin may be used in molecular diagnostic and pathology applications in normal and abnormal tissues and cell. The biomarker genes may also be used as molecular targets for therapeutics of a disorder or a disease in thumans. This sequence represents a QRT-PCR primer used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying biomarker genes using nucleic acid microarrays, useful for molecular diagnostic and pathology applications, comprises comparing the Gibbs-likelihood ratios for each gene and determining a rank order for

```
The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (1) at least 5 ribose residues 5 (1) in a 2-C-allyl modification at position 4 of the ENA, (iii) at least ten 2-O-methyl modifications; and (iv) a 3-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. The PNA's can also be used to treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis Ribozyme therapy impactes on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The end of the ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly effected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arthritic condition; graft tolerance; immune response; target; cleavage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead xibozyme; hairpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheunatoid arthritis; autoimmune disease; allergy; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound (I) 8-80 nucleobases in length targeted to a nucleic acid molecule encoding hydroxysteroid 11-beta dehydrogenase 1. inhibiting expression of hydroxysteroid 11-beta dehydrogenase 1. The methods and compositions of the present invention are useful for treating disorders associated with hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes, atherosclerosis and hyperlipidaemia. This sequence represents an antisense oligonucleotide used to control the expression of human hydroxysteroid 11-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compounds useful for treating disorders associated with hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes and atherosclerosis.

30-MAR-2001

```
The present invention describes a novel enzymatic nucleic acid (ENA)

(ii) a 2'-C-allyl modification at position. The ENA; (iii) at least 5 ribose residues

(iii) a 2'-C-allyl modifications; and (iv) a 3'-end modification. The ENA's

cc in inhibit collagenase and stromelysin production in the synovial

cc an inhibit collagenase and stromelysin production in the synovial

con inhibit collagenase and stromelysin production in the synovial

con inhibit collagenase and stromelysin production of arthritis,

con inhibit collagenase and stromelysin production of arthritis,

con inhibit collagenase and stromelysin production of arthritis,

con inhibit collagenase and stromelysin production of a donor to induce tolerance

con a recipient to an alloantigen presenting cells of a donor to induce tolerance

controlly and inclease of contracting autoimmune disease, and for

controlly allergies and other inflammatory conditions. The ENA's can also

controlly allergies and other inflammatory conditions. The ENA's can also

controlly allergies and other inflammatory conditions. The ENA's can also

controlly allergies and other inflammatory conditions. The expession of

stromelysin without introducing the non-specific effects upon gene

controlling allergies. Ribozyme required to affect a therapeutic treatment

concentration of ribozyme required to affect a therapeutic treatment

controlling and examplification of the

controlling and example the controlling and example to a therapeutic treatment

controlling and example to affect a therapeutic treatment

controlling and example to affect a therapeutic treatment

controlling and example to a therapeutic treatment

controlling and example to affect a therapeutic treatment

The present invention relates to a method for ameliorating the effects of antisense colacters. The method comprises contacting the skin with an antisense oligomuclectide, (for Insulin-like Growth Pactor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF45151 and AAF45153-6150muclectides of the present invention (see AAF45151 and AAF45153-616thyosis, pityriasis, thus, plants, serborrhoea, kelotds, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3.1%; Score 13.4; DB 1; Length 15; 93.3%; Pred. The invention relates to a method of treating deficiency of insulin, that involves administering a hedgehog protein or nucleic acid encoding the hedgehog protein. The hedgehog proteins not be used in the method are selected from sonic hedgehog (Shh), indian hedgehog (Ihh) and desert hedgehog (Dhh). The method is useful for treating deficiency of insulin in a patient afflicted with diabetes, by stimulating insulin production in pancreatic beta-cells PBO). It is also used to treat deficiency of Insulin in patient, by stimulating IDX-1 production in PBC. The hedgehog protein is useful for modulating IDX-1 gene expression or its protein in PBC. This is used to treat deficiency of PBC in a patient, by stimulating neogenesis form beta-cell pancreatic ductal precursor cells. Inhibitors of the hedgehog proteins are useful for suppressing secretion of insulin in a patient affilicted with hyperinsulinemia. Sequences AAF84001-4002 represent PCR primers for ampliying the rat Dhh cDNA fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating deficiency of insulin, IDX-1 or pancreatic beta cells in a patient by, administering a hedgehog protein, nucleic acid encoding the protein or cells expressing the protein.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates and quantify hospide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific blomclecule and/or amount apecifically of hGDMLP proteins, as specific blomclecule and/or amount apecifically of hGDMLP proteins, as specific blomclecule capture probes for surface-enhanced laser describing in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and with the expression of hGDMLP-1 sequence in patients and in the screening of the chopy selection with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a chopy sequence and in the expression of the present invention. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is concoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome concoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome concoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome concoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome concoded at chromosome concoded and modification of modification concoders. The modification concoders associated with decreased or increased expression or activity of MDZ3. Consed by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic consed by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic consed by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic consed by mDZ3, MDZ4, MDZ7, or MDZ12. The nucleic consed by mDZ3, wMZ4, MDZ7, or MDZ12. The nucleic consedul in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; immunostimulant; gene therapy; vaccine; human;
